Carbide Grade Selection

Choose the C.P.T. grade specifically formulated for your application from the following list:

Coated Grades

HBA (H10-H25) (S10-S25)	Extra-fine sub-micron grade with high toughness , for optimized performance on hardened steels and cast iron up to 62HRc, titanium alloys and super alloys (hastelloy, inconel and nickel based alloys).
BLU (M10-M20) (K05-K20) (N10-N20) (S10-S20)	PVD triple layer coated sub-micron grade for stainless steels, cast iron, titanium, non ferrous metals and most of the high temperature alloys.
BMA (P20-P40) (K20-K30)	PVD TiAlN coated sub-micrograin grade for stainless steels and exotic materials at medium to high cutting speeds.
P25C (P15-P35)	PVD TiN coated grade for treated and hard alloy steels (25 HRc & up) at medium to low cutting speeds.
MXC (K10-K20) (P10-P25)	PVD TiN coated micrograin for free cutting untreated alloy steels (below 30 HRc), for stainless steels and cast iron.
BXC (P30-P50) (K25-K40)	PVD TiN coated grade for low cutting speed. Works well with wide range of stainless steels.

Uncoated Grades

P30* (P20-P30)	Carbide grade for carbon and cast steels, works well at medium to low cutting speeds.
K20* (K10-K30)	Carbide grade for non ferrous metals, aluminum and cast iron.

* Upon request

Note: Due to our unique and specialized production techniques, C.P.T. coated inserts provide superior cutting performance and exceptionally long tool life.

Type B - Threading Inserts

A combination of ground profile, and sintered chip-breaker threading inserts. Unlike most other manufacturers' inserts, this combination ensures a consistent high quality thread, with precise shape and dimensions.

Two different unique styles of chip-breaker were designed to suit the different specific requirements of Internal threads and External threads.

All of C.P.T. Type B inserts are made of BMA Sub-Micrograin grade.

Number of threading passes selection for single point inserts

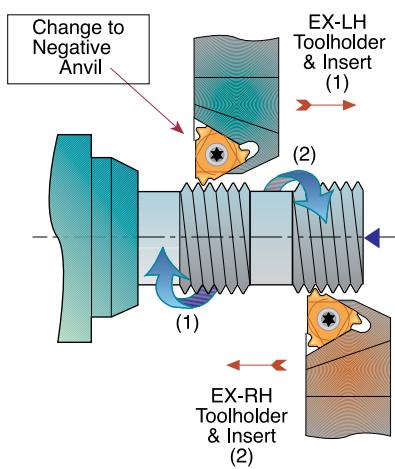

Pitch: mm TPI	0.5 48	0.8 32	1.0 24	1.25 20	1.5 16	1.75 14	2.0 12	2.5 10	3.0 8	4.0 6	6.0 4
Number of Passes	3-6	4-7	4-9	6-10	5-11	9-12	6-13	7-15	8-17	10-20	11-22

NOTES:

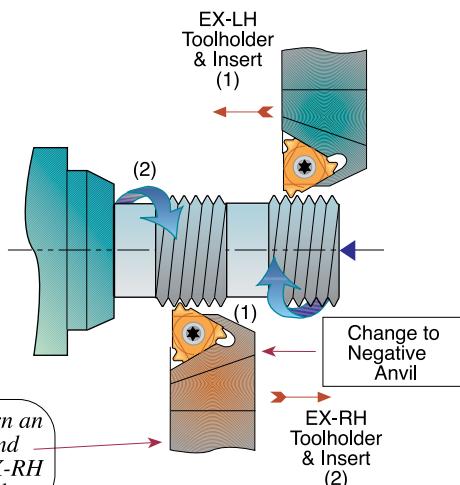

1. For most standard applications the middle of the range is a good starting point.
2. For most materials, the tougher the material, the higher the number of cutting passes you should select.
3. As a general rule of thumb, fewer passes are better than more speed.

Thread Turning Methods

EX-RH Thread

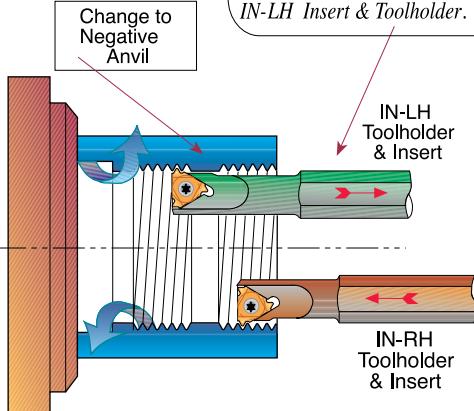

EX-LH Thread

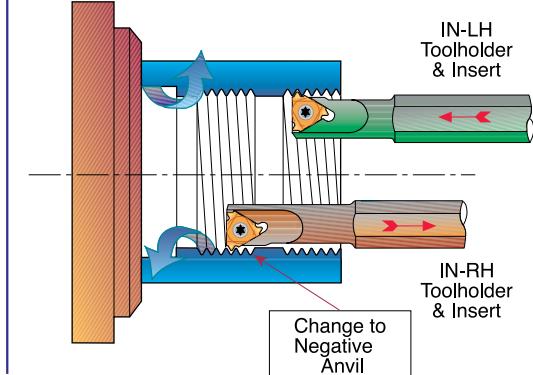

If you want to turn an EX-LH Thread and you only have EX-RH Insert & Toolholder.

IN-RH Thread

If you want to turn an IN-RH Thread but you prefer to pull the metal chips while Thread Turning outwards, you should use an IN-LH Insert & Toolholder.

Important Points about C.P.T. Threading Inserts

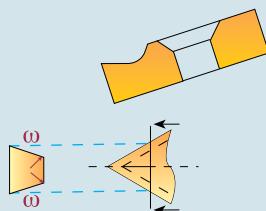

1. In most thread forms internal and external threads have different depth and radii, thus tools are not interchangeable

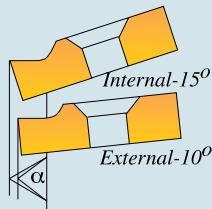

2. The Insert relief angle of a standard C.P.T. external toolholder is 10°; for an internal toolholder it is 15°. This 5° difference is to provide additional necessary radial clearance.

3. Our built-in relief angles ensure automatic insert flank angle clearance.

4. Profiles of C.P.T. internal & external threading inserts are precision ground to ensure accurate thread geometry when used in their corresponding toolholders. Using internal inserts with an external holder will result in distortion of angle and insert geometry.

5. Insert and toolholder should always match. An IN-RH insert must be used with an IN-RH toolholder. No mismatch is allowed.

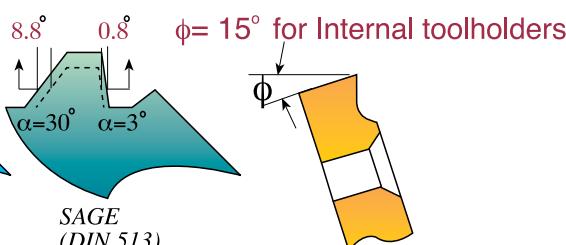

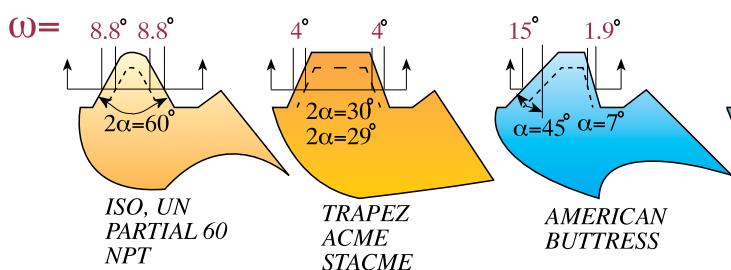

Flank Clearance Angle ω

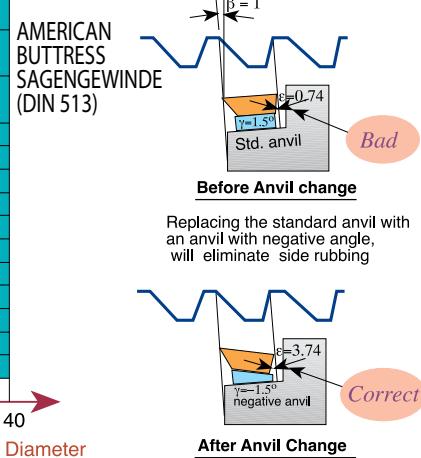

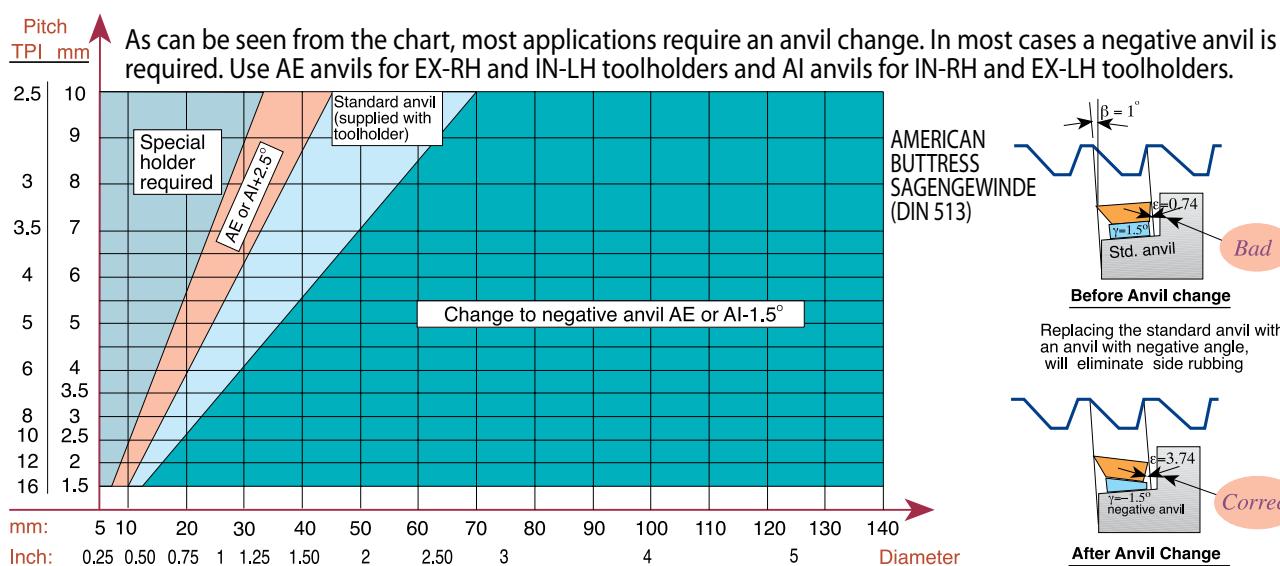

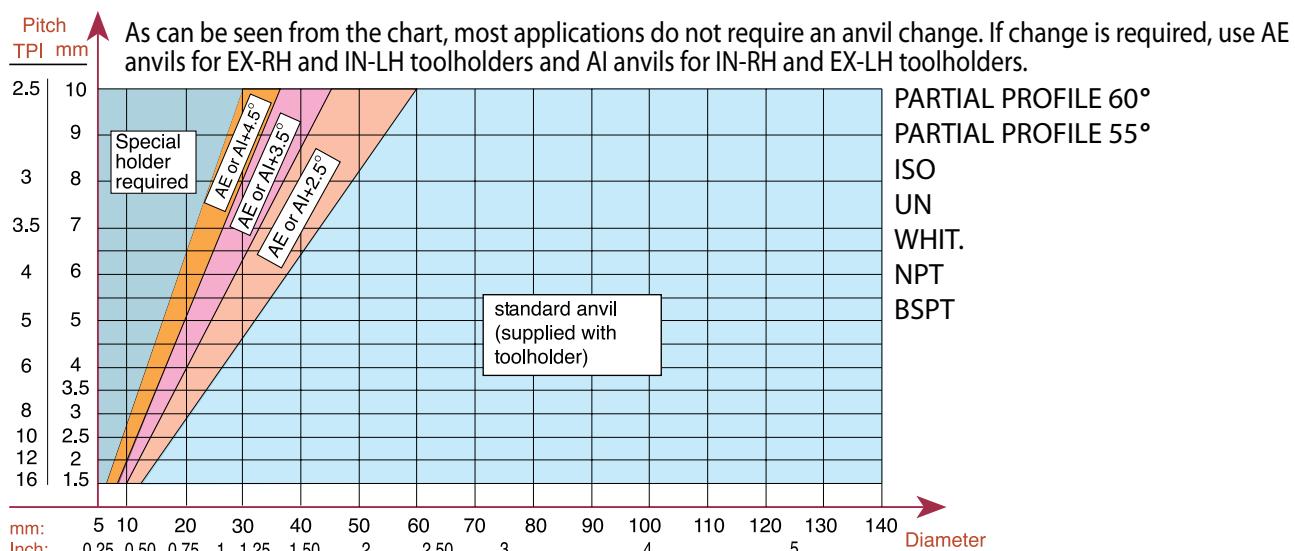

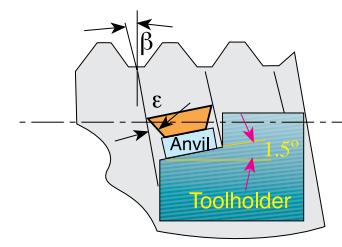

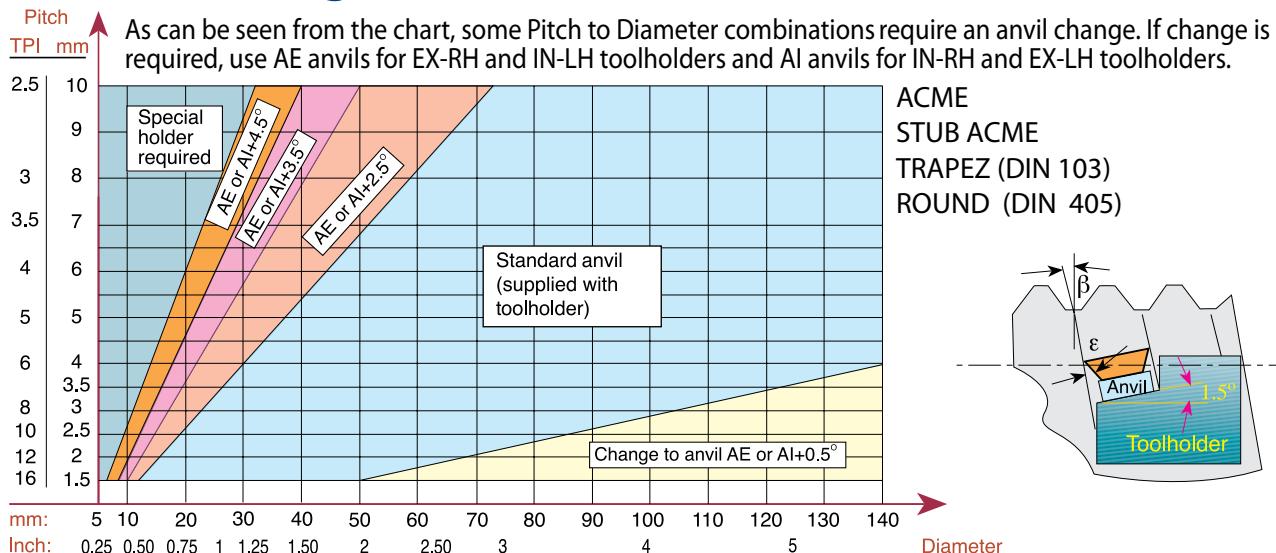

$$\omega = \begin{cases} 5.8^\circ & 5.8^\circ \\ 2.6^\circ & 2.6^\circ \\ 10^\circ & 1.24^\circ \end{cases}$$

$$\omega = \text{ArcTan} (\tan \alpha \times \tan \phi)$$

$\phi = 10^\circ$ for External toolholders
